

Application Deployment on Premise

1. Free Style Project / Job

a. Front End Deployment

Step-1:

You can start working on ecommerce front end project sent to your mail

(When extracting the project archive (e.g., ZIP or RAR file), please ensure that you extract it directly to the Desktop in such a way that all supporting files and folders are located within a single main project folder.)

or

You can choose your own project which was done in the previous semester

Note:

Folder (Desktop) -> Local Repository

Step-2:

Create a remote repository with same name on GITHUB

Step-3:

Access local repository through visual studio code with the help of command prompt

CMD:

code .

Step-4:

Ensure that the base value in the **vite.config.js** file matches exactly with the basename in your **App.jsx** file

Example:

```
// vite.config.js
```

```
  "base": "/ecommerce-frontend/"
```

```
// App.jsx
```

```
  <BrowserRouter basename="/ecommerce-frontend">
```

Step-5:

Now run the project or application on local host

CMD:

To install node modules

- npm install

To run on local host

- npm run dev

Once the application successfully runs go to the next step

Step-6:

Now push the code from local repository to remote repository using VS code terminal (GIT STEPS TO PUSH)

Step-7:

Run Tomcat Server

program files

Apache Software Foundation

tomcat 9.0

bin

Tomcat9 (Double click this application to run tomcat)

Step-8:

Access Jenkins (<https://localhost:9090>)

a. Create a new item

- Frontend project
(Type of Project – Free style project)

b. General

- Description
(Provide any description about project)

c. Source Code Management

- GIT
-your remote repository URL

- Change master to main

d. Trigger

- * * * * *

e. Environment

- Delete workspace

f. Build Setup

- Add build setup (1st one)
call npm install
call npm run build
- Add build setup (2nd one)

```
rmdir /S /Q "C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps\ecommerce-frontend"
```

```
mkdir "C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps\ecommerce-frontend"
```

```
xcopy /E /I /Y dist\* "C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps\ecommerce-frontend"
```

Finally click on **save** the build process will automatically start in 1 minute if not manually click on **Build Now**

Step-9:

Now access the project or application using Apache Tomcat

- <https://localhost:8080>

- Click on manage apps

- you will find your application (Click on that where your application is deployed on server)
